

Average number of people newly diagnosed with HIV per day, selected years

NEWLY DIAGNOSED HIV CASES

In February 2019, there were 1,013 newly confirmed HIV-positive individuals reported to the HIV/AIDS & ART Registry of the Philippines (HARP). Fifteen percent (153) had clinical manifestations of advanced HIV infection (WHO clinical stage 3 or 4) at the time of diagnosis [Table 1].

Ninety-six percent (968) of the newly diagnosed were male. The median age was 28 years old (age range: 2 - 66 years old). More than half of the cases (53%, 532) were 25-34 years old and 29% (297) were 15-24 years old at the time of testing.

Almost a third (32%, 328) were from the National Capital Region (NCR). Region 4A (17%, 171), Region 3 (12%, 122), Region 7 (9%, 90), and Region 6 (7%, 71). Comprised the top five regions with the most number of newly diagnosed cases for the month, together accounting for 77% of the total [Figure 2].

Sexual contact remained as the predominant mode of transmission (98%, 988). Among the newly diagnosed, 60% (603) reported transmission through male to male sex, 24% (243) through sex with both males and, and 14% (142) were through male to female sex. Other modes of transmission were sharing of infected needles (1%, 11) and mother-to-child transmission (<1%, 2). There were 12 cases that had no data on mode of transmission.

Among the newly diagnosed females this month, three were pregnant at the time of diagnosis. One case each from Regions 6, 8, and CARAGA.

Anti-retroviral Treatment (ART)

In February 2019, there were 810 patients who were initiated on ART. The median CD4 of these patients upon enrollment was 185 cells/mm³ [Figure 3].

A total of 35,278 people living with HIV (PLHIV) were presently on ART as of February 2019. Most of whom were males (97%). The age of reported cases ranged from 9 months to 80 years (median: 31 years old). Ninety-five percent were on first line regimen, 4% were on second line, and 1% were on other line of regimen.

Fig. 3: Number of ART initiation per month, 2017-2019

The total figure reflected on this section are the number of HIV positive adult and pediatric patients currently enrolled and accessing Antiretroviral (ARV) medication in 88 treatment hubs and primary HIV care treatment facilities that had reported in the HARP. This report did not include patients who have previously taken ARV but have died, left the country, have been lost to follow-up and/or opted not to take ARV. Lost to follow-up is considered once a person has failed to visit a treatment facility more than 3 months after the expected date of ARV refill.

Note: January 2019 data were used for Mabalacat RHWC, EVRMC, and Bernardo SHC due to late report submission. While partial February 2019 data were used for Marikina SHC and SPMC.

HIV/AIDS EPIDEMIC TRENDS IN THE PHILIPPINES (January 1984 - February 2019)

The first case of HIV infection in the Philippines was reported in 1984. Since then, there have been 64,291 confirmed HIV cases reported to the HARP. Ninety-four percent (60,239) of those diagnosed were male and 6% (4,041) were female; there were no data on sex for 11 cases. At the time of diagnosis, more than half (51%, 32,786) were from the 25-34 year age group while 18,232 (28%) were youth 15-24 years old. The median age of diagnosis was 28 years old (age range: 1 month - 82 years); there were no data on age for 73 cases. Seventy-four percent (47,815) of the total diagnosed cases in the Philippines were reported from January 2014 to February 2019. Twelve percent (7,447) of the total ever reported cases had clinical manifestations of advanced infection at the time of reporting (WHO clinical stage 3 & 4) [Table 1].

Fig. 4: Number of HIV cases reported in the Philippines by year, Jan 1984 to Feb 2019 (N=64,291)

Age and Sex

In the early years of the epidemic (1984-1990), 62% (133 of 216 cases) of those diagnosed were female. However, since 1991 the proportion of diagnosed males has been greater than that of females each year. From 1991 to present, males comprised 94% (60,156) of the 64,064^a diagnosed cases in the Philippines. In addition, from January 2018 to February 2019, three percent (390) of 12,986 diagnosed people who were assigned male at birth reported their self-identity as female (transgender women^b).

The number of diagnosed HIV infections among females has also been increasing [Figure 5]. The number of females diagnosed (45) in February 2019 were nearly triple the

Fig. 5: Number of females diagnosed per year, Jan 1984 to Feb 2019 (N=4,041)

Geographic distribution

From January 1984 to February 2019, the regions with the most number of reported cases were NCR with 25,148 (39%) cases, Region 4A with 9,618 (15%) cases, Region 3 with 5,939 (9%) cases, Region 7 with 5,773 (9%) cases, and Region 11 with 3,560 (6%) cases. Twenty percent (13,115) of the cases came from the rest of the country (ROTC) while 1,138 (2%) did not report region of residence [Table 2].

Of the 4,041 females reported with HIV, 1,052 (26%) were from NCR, 629 (16%) were from Region 3, 504 (12%) were from Region 7, 448 (11%) were from Region 4A and 1,105 (27%) were from other regions; while 303 (8%) had no reported data on region of residence.

The regions with the most number of overseas Filipino workers (OFW) reported to HARP were from NCR with 2,098 (33%) cases, Region 4A with 1,120 (17%) cases, and Region 3 with 748 (12%) cases.

number compared to the diagnosed cases (18) in same period of 2014, five years prior. Ninety-three percent (3,744) of all female cases since 1984 were in the reproductive age group (15-49 years old) at the time of diagnosis.

The predominant age group among those diagnosed has shifted to 25-34 years old starting from 2006 from 35-49 years old between 2001 to 2005 [Figure 6]. Further, the proportion of HIV positive cases in the 15-24 year age group nearly doubled in the past ten years, from 17% in 2000-2009 to 29% in 2010-2019.

^aNo data on sex for 11 cases

^bData on transgender identity was captured in HARP starting January 2018.

^bNo data on region of residence for 1,138 (2%) cases

Modes of transmission

From January 1984 to February 2019, sexual contact among MSM (85%, 51,010) was the predominant mode of transmission among males, followed by male-female sex (11%, 6,625), and sharing of infected needles (3%, 2,055). More than half of MSM (53%, 26,882) were 25-34 years old at the time of testing, and 31% (15,633) were 15-24 years old. Among diagnosed females, male-female sex was the most common mode of transmission (92%, 3,729) followed by sharing of infected needles (3%, 128) [Table 3].

A total of 163 children (less than 10 years old*), eight adolescents (10-19 years old*), and one adult foreigner (22 years old*) were reported to have acquired HIV through mother-to-child transmission.

From 1984 to 2006, the predominant mode of transmission was male-female sex. From 2007, the trend shifted to sexual contact among MSM as the predominant mode of transmission and has remained as such to the present. From January 2014 to February 2019, 83% (39,771) out of the total (47,815) diagnosed cases were among MSM.

From 1984 to 2009, transmission through sharing of infected needles were less than one percent of the total cases reported. The proportion of HIV cases among people who inject drugs (PWID) increased sharply in 2010, at 9% (147) of the total cases reported that year. Further, the proportion of new cases among PWID decreased to <6% of the total cases in the succeeding years (2011-present).

Table 3. Modes of HIV transmission

Mode of Transmission	Feb 2019 (N=1,013)		Jan-Feb 2019 (N=2,262)		Jan 2014-Feb 2019 (N=47,815)		Jan 1984-Feb 2019 (N=64,291) ^a	
	M ^a	F ^a	M	F	M	F	M	F

^a Sex at birth; M= Male, F = Female

^b No data on sex for 11 cases

^c Among males only

Regional patterns vary across the modes of transmission. Forty-two percent of ever diagnosed males who have sex with males were from NCR; almost all (99%) reported cases among people who inject drugs were from Region 7; and 32% of females who engaged in transactional sex were from Region 3.

* Based on the age at the time of diagnosis

Fig. 7: Cumulative number of diagnosed per year by mode of transmission, Jan 1984 to Feb 2019 (N=64,291)

^a No reported Mode of Transmission (MOT) for (549) cases, Jan 1984–Feb 2019

^b Others include the following MOT: needle prick injury, blood/blood products, and mother-to-child transmission

Note: Cumulative HIV cases include reported death

SPECIFIC POPULATIONS

Youth (15-24 years old)

In February 2019, 297 (29%) cases were among youth 15-24 years old; 95% were male. Almost all (98%, 292) were infected through sexual contact (28 male-female sex, 193 male-male sex, 71 sex with both males & females*). One (<1%) was infected through sharing of needles and four (1%) had no data on mode of transmission.

From January 1984 to February 2019, 18,232 (28%) of the reported cases were 15-24 years old. Ninety-seven percent (17,641) were infected through sexual contact (2,008 male-female sex, 10,442 male-male sex, 5,191 sex with both males & females*), 474 (3%) were infected through sharing of needles, one (<1%) was infected through mother-to-child transmission and 116 (1%) had no data on mode of transmission. Seventy-seven percent (14,048 out of 18,232) of all those 15-24 years old at the time of testing were diagnosed from January 2014 to February 2019. From 1984 to 2002, 71% (179) of the cases among the youth were females. However, in 2003, there was an equal number (7) of males and females reported. Since then, the trend has shifted to male predominance.

* Among males only

Children (<10 yo) & Adolescents (10-19)

In February 2019, there were 47 newly diagnosed adolescents 10-19 years old at the time of diagnosis. Further, 10 cases were 15-17 years old and 37 cases were 18-19 years old. Almost all were infected through sexual contact (5 male-female sex, 29 male-male sex, and 11 had sex with both males & females), one was infected through sharing of needles and one had no data on mode of transmission. In addition, there were two diagnosed cases less than 10 years old and both were infected through mother-to-child transmission.

Four percent (2,690) of all diagnosed cases from January 1984 to February 2019 were 19 years old and younger at the time of diagnosis. Of these, 166 (6%) were children less than 10 years old. Among them 163 were infected through mother-to-child transmission; one through blood transfusion; and two had no data on mode of transmission. Ninety-four percent (2,524 out of 2,690) were adolescents 10 to 19 years old. Further, 19 were 10-14 years old, 328 were 15-17 years old and 2,177 were from 18-19 age group. Ninety-five percent of the adolescents were infected through sexual contact (288 male-female sex, 1,551 male-male sex, and 570 sex with both males & females), 88 (3%) were infected through sharing of infected needles, 8 (<1%) through mother-to-child transmission, and 19 (1%) had no data on the mode of transmission.

Fig. 8: Modes of transmission among children and adolescents, Jan 1984 to Feb 2019 (N=2,690)

* Transmitted through sexual contact

People who engage in transactional sex

People who engage in transactional sex are those who reported that they either pay for sex, regularly accept payment for sex, or do both. Reporting of transactional sex was included in the HARP starting December 2012.

In February 2019, 11% (107) of the newly diagnosed engaged in transactional sex [Table 4]. Ninety-eight percent (105) were male and aged from 17 to 66 years old (median: 30 years). Majority of the males (57%, 60) reported paying for sex only, 30% (32) reported accepting payment for sex only and 12% (13) engaged in both. In addition, both of the two female cases were reported to have accepted payment for sex.

A total of 6,322 cases reported to HARP from December 2012 to February 2019 were people who engaged in transactional sex. Ninety-six percent (6,067) were male and 4% (255) were female. There were 3,394 (54%) who paid for sex, 1,975 (31%) who accepted payment for sex, and 953 (15%) who engaged in both [Table 4].

Overseas Filipino Workers (OFW)

Eighty-eight Filipinos who worked overseas within the past five years, whether on land or at sea, were diagnosed in February 2019. They comprised 9% of the total newly diagnosed cases for the month. Among them, ninety-three percent (82) were male. All were infected through sexual contact (20 male-female sex, 45 male-male sex, and 23 sex with both males and females). The ages of male OFWs ranged from 18 to 63 years (median: 31 years). More than half (57%) of the cases belonged to the 25-34 year age group. Among the six female OFWs diagnosed in February 2019, one case was from 15-24 age group, two cases were from age groups 25-34 years old, two cases were 35-49 years old and one case was older than 50 years. The age range among diagnosed female OFWs were 24 to 54 years (median: 36 years).

From January 1984 to February 2019, ten percent (6,433) of the total cases were OFWs (Figure 9). Of these, 5,553 (86%) were male. Majority (72%) of the transmission among male OFW cases were through sexual contact among MSM (2,328 male-male sex and 1,674 sex with both males and females). The ages of male OFWs ranged from 16 to 80 years (median: 32 years). Among female OFWs, ages ranged from 20 to 73 years (median: 34 years old).

Fig. 9: Number of reported OFW diagnosed with HIV, Jan 1984 to Feb 2019 (N=6,433)

Table 4. Age and sex of people diagnosed with HIV who engaged in transactional sex

Type of Transactional Sex	Feb 2019 (N=107)	Jan-Feb 2019 (N=255)	Dec 2012-Feb 2019 (N=6,322)
Accepted payment for sex only:	34 (32%)	71 (28%)	1,975 (31%)
Male	32	64	1,821
Female	2	7	154
Age Range (Median)	17-43 (26)	17-55 (26)	12-68 (26)
Paid for sex only:	60 (56%)	149 (58%)	3,394 (54%)
Male	60	149	3,373
Female	0	0	21
Age Range (Median)	18-66 (32)	18-72 (32)	14-79 (31)
Engaged in both:	13 (12%)	35 (14%)	953 (15%)
Male	13	35	873
Female	0	0	80
Age Range (Median)	21-40 (28)	18-52 (30)	15-62 (29)

Pregnant women living with HIV

Reporting of pregnancy status at the time of testing was included in the HARP from the year 2011.

In February 2019, three pregnant women were newly diagnosed with HIV. One each from Regions 6, 8 and CARAGA. The age of diagnosis ranged from 23 to 34 (median age: 26).

Since 2011, a total of 304 diagnosed pregnant cases were reported. More than half (56%, 169) were 15-24 years old at the time of diagnosis, and 38% (115) were 25-34 years old [Figure 10]. The regions with highest number of diagnosed pregnant cases with HIV were NCR (49%), Region 7 (23%), Region 4A (9%), and Region 3 (6%).

Fig. 10: Number of HIV positive woman who were pregnant at the time of diagnosis by age group, Jan 2011 to Feb 2019 (N=304)

DEATHS AMONG PEOPLE WITH HIV

In February 2019, there were 59^a reported deaths due to any cause among people with HIV and 95% of whom were males [Table 5]. Four cases (7%) were 15-24 years old at the time of death, 37 cases (63%) were 25-34 years old, 15 cases (25%) were 35-49 years old and three (5%) were older than 50 years. Almost all of the cases were reported to have acquired the infection through sexual contact: 10 through male-female sex, 34 through male-male sex, and 13 through males who have sex with both males and females. Two reported deaths had no data on mode of transmission.

A total of 3,135 deaths were reported from January 1984 to February 2019 and 91% (2,826) of whom were male. Twenty-three (1%) were less than 15 years old at the time of death, 474 (15%) were 15-24 years old, 1,556 (50%) were 25-34 years old, 871 (28%) were 35-49 years old, and 209 (6%) were 50 years and older [Table 5]^b.

Sexual contact (96%) was the most common mode of HIV transmission among reported deaths (677 male-female sex, 1,484 male-male sex, 855 sex with both males and females). Other mode of transmission of reported deaths were sharing of infected needles (59), mother-to-child transmission (22), and blood transfusion (9)[Figure 11]^c.

^a Based on the date reported; the actual date of death may not necessarily fall in this reporting month
^b No data available on age for 2 cases
^c No data available on mode of transmission for 29 cases

HIV/AIDS & ART Registry of the Philippines (HARP)

The HIV/AIDS & ART Registry of the Philippines (HARP) is the official record of total number of diagnoses (laboratory-confirmed) and deaths among people with HIV in the Philippines. All individuals in the registry are confirmed by the San Lazaro Hospital STD/AIDS Cooperative Central Laboratory (SACCL) which is the National Reference Laboratory (NRL) of the Department of Health (DOH) for HIV/AIDS. Mandatory HIV testing is unlawful in the Philippines (Republic Act 11166).

The process of reporting to the HARP is as follows: All blood samples from accredited HIV testing facilities that are screened HIV reactive are sent to SACCL for confirmation by Western Blot. Confirmed HIV positive individuals are reported to the DOH-Epidemiology Bureau (EB) and are recorded in the HARP.

The HARP is a passive surveillance system. Except for HIV confirmation by the NRL, all other data submitted to the HARP are secondary and cannot be verified. As such, HARP cannot determine if an individual's reported place of residence is where the person got infected, or where the person lived after being infected, or where the person is presently living. This limitation has major implications on data interpretation. Readers are advised to interpret the data with caution and consider other sources of information before arriving at conclusions.
